sharp. It can be combined with DR correction modes, but this risks making shadow noise even more noticeable. We extract offers for your location, please update the page to see the prices. Page 9 Our latest test scene is designed to simulate both daylight and low-light photography. Pressing the lighting buttons at the top of the widget allows you to switch between them. The daylight scene is filmed with a manual white balance set, but the camera remains in automatic settings for low-light tests. Based on the ISO, the G1 X Mark II doesn't look much different from its predecessor, although it shows a little more moir. The ISO 800 camera supports a good amount of detail, especially compared to the Sony Cyber-shot DSC-RX100 II. Noise-wise, the G1 X II performs similarly to the original G1 X. When we reach the ISO 3200 the original G1 X is slightly better in terms of noise, while the Mark II works better than the smaller touch of the Sony RX100 II, even if normalized. While the noise increases and the parts begin to slide on the ISO 6400, the photos are still very useful, especially in print sizes. The same can be said for the G1 X II top ISO 12800: although not miraculous in full size when cut for printing or web sharing, still look pretty good. Aside from some moir, there's not much to say about the G1 X II raw performance at low ISOs. At the average ISO 800 in this case), the Mark II is comparable to the original G1 X, as well as the EOS 700D Canon. Canon. The Sony RX100 II is very close when the image size is normalized. Chrome noise starts to appear on ISO 1600, and ISO 3200 results in the loss of parts. On the upper sensitivity (ISO 12800) the chrome noise took out most of the details in the scene, and gave this guy a bloody nose. Low light JPEGs are lighter than in daylight, which is no surprise. Comparing the two G1 X models, you'll find that the Mark II is a little more awe-free than its predecessor. Canon does a good job of reducing chrome noise in its JPEGs, but this is due to small details. When recording raw files, the chrome noise starts hitting the finer details around the ISO 3200, with some false color visible as well. Things don't get drastically worse in the top two sensitivities, although it's worth noting once again that the G1 X Mark II has a little more chrome noise than the G1 X as the ISO rises.
